

Sidlesham School Calculation Policy

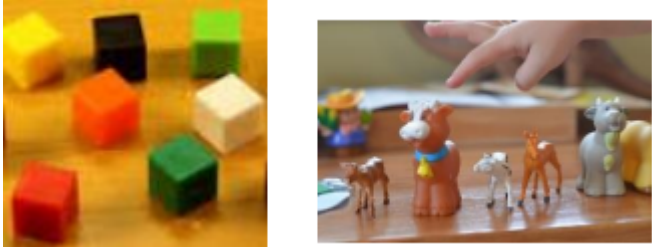

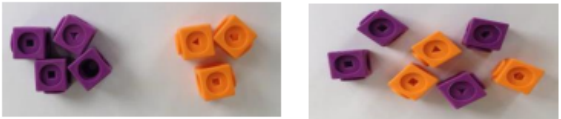

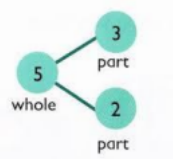

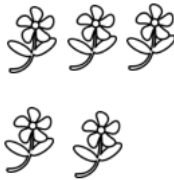

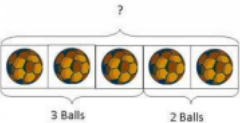

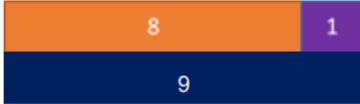

Building skills and values for life

CALCULATION POLICY

This policy lays out the expectations for both mental and written calculations for the 4 number operations and has been created to support the teaching of a mastery approach within mathematics. This is underpinned by the use of models and images that support conceptual understanding and this policy promotes a range of representations to be used across the primary years. Mathematical understanding is developed through use of representations that are first of all concrete (e.g. Dienes apparatus and place value counters), and then pictorial (e.g. bar models) to then facilitate abstract working (e.g. standard written methods). This policy is a guide through an appropriate progression of representations and if at any point a pupil is struggling with the abstract, they should revert to familiar pictorial and/or concrete materials/representations as appropriate.

Although this policy sets out the main methods of mental and written calculations to be taught, it has been appended with a list of recommendations and effective practice teaching ideas aimed at informing and enhancing teaching across all the primary phases. Many of these ideas come from the NCETM's Calculation Guidance document (published October 2015) which is intended to sit alongside a school's calculation policy.

Progression in Addition Calculations

Method	Concrete	Pictorial	Abstract										
<p>Stage 1 Counting a set of objects. This can include counting using fingers.</p>			<table border="1" data-bbox="1720 280 1944 536"> <tr> <td></td> <td>3</td> </tr> <tr> <td></td> <td>5</td> </tr> <tr> <td></td> <td>1</td> </tr> <tr> <td></td> <td>2</td> </tr> <tr> <td></td> <td>4</td> </tr> </table> <p>Children relate the number of objects to the numeral.</p>		3		5		1		2		4
	3												
	5												
	1												
	2												
	4												
<p>Stage 2 Combining 2 separate amounts to make 1 whole amount.</p>	 <p>For $4 + 3$, count out 4 cubes then 3 more and group them together to see what they have altogether.</p> <p>This can also be represented in a bar. E.g. for $8 + 1$:</p> 	  <p>Use pictures to add two numbers together as a group or in a bar.</p>  	 <p>Use the part-part whole diagram as shown above to move into the abstract.</p> <p>$4 + 3 = 7$ $10 = 6 + 4$</p> <p>Although number sentences are recorded in the concrete and pictorial methods, the abstract method sees the calculation carried out without the use of concrete or pictorial aids.</p>										

Stage 3
Start at the bigger number and count on

Start with the larger number on the bead string and then count on to the smaller number 1 by 1 to find the answer.

Counting on in jumps of 1 using a number line with numbers on it.

For $6 + 3 = 9$:

This can also be done in bigger jumps or 1 big jump to find the answer.

For $12 + 5 = 17$:

$$5 + 12 = 17$$

Place the larger number in your head and count on the smaller number to find your answer.

Stage 4
Bridge to 10.

$$6 + 5 = 11$$

Start with the larger number and use the lower number to make 10. Then count the number of 10's and 1's you have.

$$3 + 9 =$$

$$9 + 5 = 14$$

to make 10 before adding.

Children move on to using an 'empty number line'.
E.g. $7 + 5$ becomes $7 + 3 + 2$

Use pictures or a number line. Regroup or partition the smaller number

$$7 + 5 = 7 + 3 + 2 = 12$$

If I have seven, how many of my 5 do I need to add to make 10. How many more do I still need to add on?

Stage 5
Column
addition
without
regrouping

$$24 + 15 = 39$$

Partition the numbers into tens and ones using Dienes blocks. Add together the ones first then add the tens. Finally add the 2 totals together.

$$44 + 15 = 59$$

Move onto using place value counters.

After practically using the Dienes blocks and place value counters, children can draw the counters to help them to solve additions.

$$32 + 23 = 55$$

$$21 + 42 =$$

$$\begin{array}{r} 21 \\ + 42 \\ \hline \end{array}$$

Record the calculation vertically adding the column of ones then the column of tens.

Stage 6
Column
addition
with
regrouping

Make both numbers with place value counters.

In this case, adding the ones gives us 13 which is made up of 10 and 3.

Exchange 10 of these ones for one 10 and add it together with the other tens.

Add up the rest of the columns, exchanging the 10 counters from one column for the next place value column if needed.

Children can draw a pictorial representation of the columns and place value counters to further support their learning and

understanding.

Begin by partitioning the numbers:

For $76 + 47$

$$\begin{array}{r} 70 + 6 \\ 40 + 7 \\ \hline 110 + 13 = 123 \end{array}$$

Move on to clearly show the exchange below the addition:

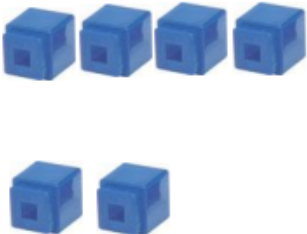

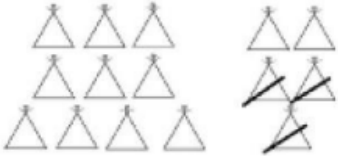

$$\begin{array}{r} 70 + 6 \\ 40 + 7 \\ \hline 120 + 3 = 123 \\ 10 \end{array}$$

This then becomes the compact method where numbers aren't partitioned but exchanges still take place:

$$\begin{array}{r} 76 \\ + 47 \\ \hline 123 \\ 10 \end{array}$$

	<p>This can also be done with Dienes equipment to help children clearly see that 10 ones equal 1 ten and 10 tens equal 100.</p> <p>As children move on to decimals, money and decimal place value counters can be used to support learning.</p>		<p>As the children move on, introduce decimals with and without the same number of decimal places. Money can also be used here.</p> $\begin{array}{r} 72.8 \\ + 54.6 \\ \hline 127.4 \\ 11 \end{array}$ $\begin{array}{r} 23.361 \\ 9.080 \\ + 1.300 \\ \hline 93.511 \\ 212 \end{array}$ <p>N.B. Exchanged digits need to be recorded below the line when adding.</p>
--	---	--	---

Progression in Subtraction Calculations

Method	Concrete	Pictorial	Abstract
<p>Stage 1 Taking away ones</p>	<p>Use physical objects, counters, cubes etc. to show how objects can be taken away.</p>  <p>$6 - 2 = 4$</p>	<p>Cross out drawn objects to show what has been taken away.</p> <p>$4 - 2 = 2$</p>   <p>$15 - 3 = 12$</p>	<p>$18 - 3 = 15$</p> <p>$8 - 2 = 6$</p> <p>Although number sentences are recorded in the concrete and pictorial methods children are introduced to them on their own while encouraging them to mentally take away ones.</p>

Stage 2
Counting back

Make the larger number in the subtraction. Move the beads along the bead string and count backwards in ones.

13 - 4

Use counters and move them away from the group counting backwards as they each one is moved away.

Count back on a number line or number track

Start at the bigger number and count back the smaller number showing the jumps on the number line.

This can progress all the way to counting back using two 2 digit numbers.

For 13 - 4, put 13 in your head and count back 4. What number are you at? Use your fingers to help.

Stage 3
Find the difference

Compare amounts and objects to find the difference.

Use cubes to build towers or make bars to find the difference.

Use basic bar models with items to find the difference.

11 - 5 = 6

Count on to find the difference.

Comparison Bar Models

Lisa is 13 years old. Her sister is 22 years old. Find the difference in age between them.

Draw bars to find the difference between 2 numbers.

Hannah has 23 sandwiches, Helen has 15 sandwiches. Find the difference between the number of sandwiches.

Stage 4
Part
Whole
Model

Link to addition- use the part whole model to help explain the inverse between addition and subtraction.

If 10 is the whole and 6 is one of the parts. What is the other part?

$$10 - 6 =$$

Use a pictorial representation of objects to show the part whole model.

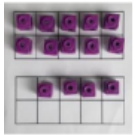

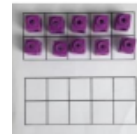

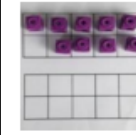

$$6 - 2 = 4$$

Move to using numbers within the part whole model.

Stage 5
Subtract to
10

Step 1	Step 2	Step 3
		

Make 14 on the ten frame. Take away the four first to make 10 and then takeaway one more so you have taken away 5. You are left with the answer of 9.

Start at 13. Count back 3 to reach 10. Then count back the remaining 4 so you have taken away 7 altogether. You have reached your answer.

$16 - 8 =$

How many do we take off to reach the previous 10? (6)

How many do we have left to take off? (2)

Stage 6
Column method
without
regrouping

Use Dienes blocks to make the bigger number then take the smaller number away.

Show how you partition numbers to subtract. Again make the larger number first.

Draw the Dienes or place value counters alongside the written calculation to help show working.

Partitioned numbers are written vertically:

For 54 - 22

Tens	Ones
50	4
- 20	2
<hr/>	
30	+ 2 = 32

This will lead to a clear written column subtraction:

54
- 22
<hr/>
32

Stage 7
Column
method
with
regrouping

Use Dienes first then move to place value counters. Start with one exchange before moving onto subtractions with 2 exchanges.

Make the larger number with the place value counters

Calculations

$$\begin{array}{r} 234 \\ - 88 \\ \hline \end{array}$$

Start with the ones. I can't take away 8 ones. I need to exchange a ten for ten ones:

Calculations

$$\begin{array}{r} 234 \\ - 88 \\ \hline \end{array}$$
 Now I can subtract 8 ones from 14.

Next look at the tens. I can't take away 8 tens. I need to exchange a hundred for 10 tens:

Calculations

$$\begin{array}{r} 234 \\ - 88 \\ \hline \end{array}$$
 Now I can take eight tens from the 12 tens and complete the subtraction.

Calculations

$$\begin{array}{r} 234 \\ - 88 \\ \hline 146 \end{array}$$

Show children how the concrete method links to the written method alongside their working. Cross out the numbers when exchanging and show where we write our new amount.

45

$$\begin{array}{r} 45 \\ - 29 \\ \hline 16 \end{array}$$

Tens | Ones
 1 ten, 5 ones
 4 tens, 15 ones
 10 + 6 = 16

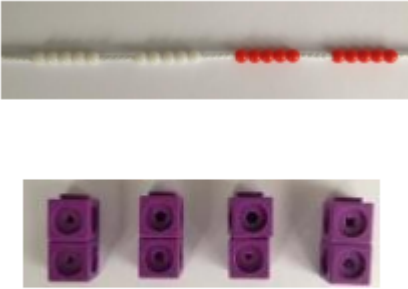

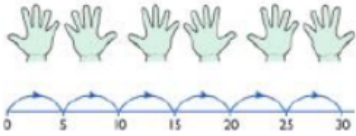

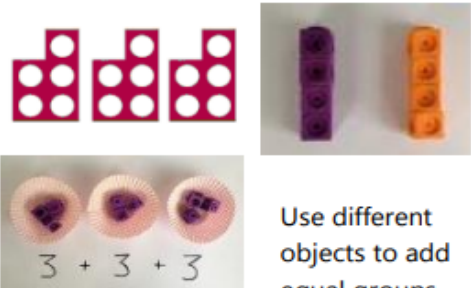

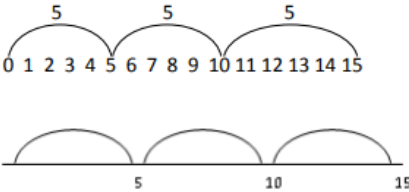

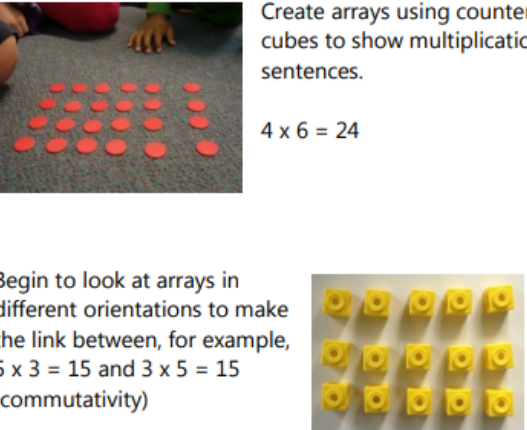

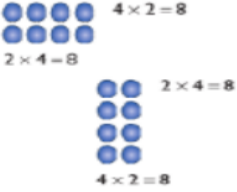

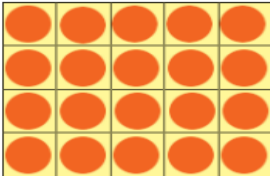

Children may draw base ten or PV counters and cross off.

Moving forward the children use a more compact method.

This will lead to an understanding of subtracting any number including decimals.

$$\begin{array}{r} 5 \quad 12 \\ 2 \quad \cancel{6} \quad \cancel{3} \quad . \quad \overset{1}{0} \\ - \quad 2 \quad 6 \quad . \quad 5 \\ \hline 2 \quad 3 \quad 6 \quad . \quad 5 \end{array}$$

Method	Concrete	Pictorial	Abstract
<p>Stage 1 Counting in multiples</p>	 <p>Count in multiples supported by concrete objects in equal groups.</p>	 <p>Use a number line or pictures to continue support in counting in multiples.</p>	<p>Count out loud in multiples of a number.</p> <p>Write sequences with multiples of numbers.</p> <p>2, 4, 6, 8, 10</p> <p>5, 10, 15, 20, 25, 30</p>
<p>Stage 2 Repeated addition</p>	 <p>Use different objects to add equal groups.</p>	<p>$5 + 5 + 5 = 15$</p>  <p>Repeated addition can be shown on a labelled or empty number line.</p> <p>Begin to relate repeated addition to multiplication using 'lots of' e.g. 3 lots of 5 = 15</p>	<p>Write addition sentences to describe objects and pictures.</p>  <p>$2 + 2 + 2 + 2 + 2 = 10$</p> <p>This then leads to writing related multiplication sentences e.g. $2 \times 5 = 10$</p>
<p>Stage 3 Arrays- showing commutative multiplication</p>	 <p>Create arrays using counters / cubes to show multiplication sentences.</p> <p>$4 \times 6 = 24$</p> <p>Begin to look at arrays in different orientations to make the link between, for example, $5 \times 3 = 15$ and $3 \times 5 = 15$ (commutativity)</p>	<p>Draw arrays in different rotations to find commutative multiplication sentences.</p>  <p>$4 \times 2 = 8$ $2 \times 4 = 8$ $2 \times 4 = 8$ $4 \times 2 = 8$</p> <p>Link arrays to area of rectangles.</p> 	<p>Use an array to write multiplication sentences and reinforce repeated addition.</p>  <p>$5 + 5 + 5 = 15$ $3 + 3 + 3 + 3 + 3 = 15$ $5 \times 3 = 15$ $3 \times 5 = 15$</p>

Stage 4
Grid Method

Children can represent the work they have done with place value counters in a way that they understand.

They can draw the counters, using colours to show different amounts or just use circles in the different columns to show their thinking as shown below.

Start with multiplying 2-digit by 1-digit numbers showing the addition alongside the grid.

X	30	5
7	210	35

$$210 + 35 = 245$$

Moving forward, multiply 2, 3 and 4-digit numbers showing the different rows within the grid method.

13 x 28			
X	20	8	
10	200	80	280
3	60	24	+ 84
			<u>364</u>
			1

Stage 5
Column
multiplication

Children can continue to be supported by place value counters for carrying out column multiplication. They can partition and record each calculation vertically.

It is important to get into the habit of multiply the ones first and note down their answer followed by the tens which they note below.

The idea of exchanging will support them in moving on to a more compact method:

As with the grid method, numbers of more than one digit are partitioned but this time the calculation is recorded vertically. To support them, children need to write out what they are solving next to their answer.

For 38 x 7

$$\begin{array}{r} 38 \\ \times 7 \\ \hline 56 \quad 8 \times 7 \\ \underline{210} \quad 30 \times 7 \\ 266 \end{array}$$

Remind the children about the importance of lining up their numbers clearly in columns.

This then moves to the more compact method of short multiplication:

For 38 x 7

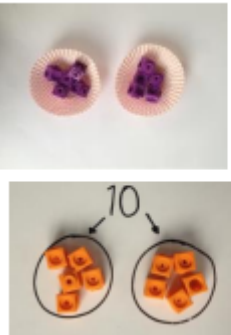

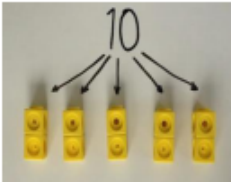

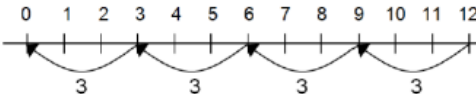

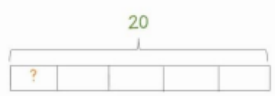

$$\begin{array}{r} 38 \\ \times 7 \\ \hline 266 \\ 5 \end{array}$$

Start by multiplying the ones digit, recording the last digit of the answer in the answer line but exchanging any tens and putting them under the tens column to be added on after multiplying the tens digit. Again, the last digit in the answer is recorded in the answer line and any hundred are exchanged, this time to the hundreds column, and so on.

For 56 x 27

$$\begin{array}{r} 56 \\ \times 27 \\ \hline 392 \quad 56 \times 7 \\ \underline{1120} \quad 56 \times 20 \\ 1512 \\ 1 \end{array}$$

Progression in Division Calculations

Method	Concrete	Pictorial	Abstract
<p>Stage 1 Sharing objects equally</p>	 <p>I have 10 cubes, can you share them equally in 2 groups?</p>	<p>Children use pictures or shapes to share quantities.</p>  <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> $8 \div 2 = 4$ </div>	<p>Share 9 buns between three people.</p> $9 \div 3 = 3$
<p>Stage 2 Division as grouping</p>	<p>Divide quantities into equal groups. Use cubes, counters, objects or place value counters to aid understanding.</p>  <p>There are 10 sweets. How many people can have 2 sweets each?</p>	<p>Use a number line to show jumps in groups. The number of jumps equals the number of groups.</p>  <p>Think of the bar as a whole. Split it into the number of groups you are dividing by and work out how many would be within each group.</p>  $20 \div 5 = ?$ $5 \times ? = 20$	$28 \div 7 = 4$ <p>Divide 28 into 7 groups. How many are in each group?</p>

Stage 3
Division within arrays

Link division to multiplication by creating an array and thinking

about the number sentences that can be created.

Eg $15 \div 3 = 5$ $5 \times 3 = 15$
 $15 \div 5 = 3$ $3 \times 5 = 15$

Draw an array and use lines to split the array into groups to make multiplication and division sentences.

Find the inverse of multiplication and division sentences by creating four linking number sentences.

$7 \times 4 = 28$
 $4 \times 7 = 28$
 $28 \div 7 = 4$
 $28 \div 4 = 7$

Stage 4
Division with a remainder

$14 \div 3 =$

Divide objects into groups or share equally and see how much is left over.

Draw dots and group them to divide an amount and clearly show a remainder.

Jump forward in equal jumps on a number line then see how many more you need to jump to find a remainder.

$13 \div 4 = 3 \text{ r}1$

As knowledge of place value improves, children can begin to jump in multiples of 10:

$92 \div 3 = 30 \text{ r}2$

Children use knowledge of times table facts to quickly calculate divisions involving remainders.

For example:

$27 \div 5 = 5 \text{ r}2$

Go on to combining knowledge of times tables with place value to calculate more difficult divisions.

For example:

$137 \div 4 = 34 \text{ r}1$

Stage 5
Short division

Use place value counters to divide using the bus stop method alongside

Calculations
 $42 \div 3$

$42 \div 3 =$
Start with the biggest place value, we are sharing 40 into three groups. We can put 1 ten in each group and we have 1 ten left over.

We exchange this ten for ten ones and then share the ones equally among the groups.

We look at how much is in 1 group so the answer is 14.

Children can continue to use drawn diagrams with dots or circles to help them divide numbers into equal groups.

Encourage them to move towards counting in multiples to divide more efficiently.

Begin with divisions that divide equally with no remainder.

$$\begin{array}{r} 18 \\ 4 \overline{) 72} \end{array}$$

Move onto divisions with a remainder.

$$\begin{array}{r} 19 \text{ r}3 \\ 4 \overline{) 79} \end{array}$$

This can also be recorded as a fraction:
 $19 \frac{3}{4}$

Finally move into decimal places to divide the total accurately.

$$\begin{array}{r} 19.75 \\ 4 \overline{) 79.300} \end{array}$$

$$\begin{array}{r} 14.6 \\ 35 \overline{) 511.210} \end{array}$$
